# Chapter 1

## Introduction

Here I will introduce the project and the thesis in general.

### 1.1 Context and Background

One of the most time consuming parts for digital artists and animators is creating differing variations of the same basic piece of artwork. In most games and other graphics applications environment assets such as trees, plants, grass, algae and other types of plant life make up the large majority of the assets within a game. Creating a tree asset can take a skilled digital artist more than an hour of work by hand, The artist will then have to create many variations of the same asset in order to obtain enough variation that a user of that graphics application would not notice that the asset has been duplicated. If you multiply this by the number of assets that a given artist will have to create and then modify, you are looking at an incredible number of hours that could potentially be put to use creating much more intricate and important assets.

The unique thing about plant life when compared with other types of graphics assets is that plant life is very random in the way it grows and it does not take an incredibly realistic model of a plant life to trick the human mind into believing that what it is seeing is some kind of plant. However what stands out like a sore thumb is when plants that are growing next to each other seemingly have no influence on the plant life around them.

### 1.2 Research Setting

This is the research setting section

### 1.3 Objectives

## Chapter 2

# Introducing Lindenmayer Systems

Aristid Lindenmayer is well known biologist who started work on what would become known as the Lindenmayer System or L-system for short. Originally they were intended to be used as a grammar for describing the development of simple organisms. However over the years they have been found to be useful in describing larger organisms and even non organic structures like music. [Worth and Stepney, 2005]

### 2.1 L-system grammars

### 2.2 D0L System

### 2.3 Basic 2D L-systems

There are a number of fractal geometry that have become well known particularly with regards to how they can seemingly imitate nature [Mandelbrot, 1982]. Particularly with the geometry such as the Koch snowflake which can be represented using the following L-system.

#### Koch Curve:

**Alphabet:** F

**Constants:** +, -

**Axiom:** F

**Angle:**  $90^\circ$

**Rules:**

$F \rightarrow F+F-F+F$

Figure 2.1: Koch Curve.

**Sierpinski Triangle:**

**Alphabet:** A, B

**Constants:** +, -

**Axiom:** A

**Angle:**  $60^\circ$

**Rules:**

$A \rightarrow B-A-B$

$B \rightarrow A+B+A$

Figure 2.2: Sierpinski Triangle.

**Dragon Curve:**

**Alphabet:** F, X, Y

**Constants:** +, -

**Axiom:** FX

**Angle:**  $90^\circ$

**Rules:**

$X \rightarrow X+YF+$

$Y \rightarrow -FX-Y$

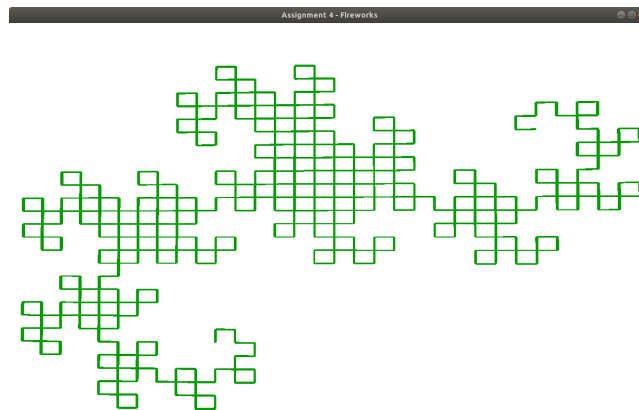

Figure 2.3: Dragon Curve.

**Fractal Plant:**

**Alphabet:** X, F

**Constants:** +, -, [, ]

**Axiom:** X

**Angle:**  $25^\circ$

**Rules:**

$X \rightarrow F-[[X]+X]+F[+FX]-X$

$F \rightarrow FF$

Figure 2.4: Fractal Plant.

**Fractal Bush:**

**Alphabet:** F

**Constants:** +, -, [, ]

**Axiom:** F

**Angle:**  $25^\circ$

**Rules:**

$F \rightarrow FF+[+F-F-F]-[-F+F+F]$

Figure 2.5: Fractal Bush.

## 2.4 Branching Filaments
