Chapter 1

Introduction

Here I will introduce the project and the thesis in general.

1.1 Context and Background

One of the most time consuming parts for digital artists and animators is creating differing variations of the same basic piece of artwork. In most games and other graphics applications environment assets such as trees, plants, grass, algae and other types of plant life make up the large majority of the assets within a game. Creating a tree asset can take a skilled digital artist more than an hour of work by hand, The artist will then have to create many variations of the same asset in order to obtain enough variation that a user of that graphics application would not notice that the asset has been duplicated. If you multiply this by the number of assets that a given artist will have to create and then modify, you are looking at an incredible number of hours that could potentially be put to use creating much more intricate and important assets.

The unique thing about plant life when compared with other types of graphics assets is that plant life is very random in the way it grows and it does not take an incredibly realistic model of a plant life to trick the human mind into believing that what it is seeing is some kind of plant. However what stands out like a sore thumb is when plants that are growing next to each other seemingly have no influence on the plant life around them.

Chapter 2

Introducing Lindenmayer Systems

Aristid Lindenmayer is well known biologist who started work on what would become known as the Lindenmayer System or L-system for short. Originally they were intended to be used as a grammar for describing the development of simple organisms. However over the years they have been found to be useful in describing larger organisms and even non organic structures like music. [Worth and Stepney, 2005]

2.1 L-system grammars

According to Prusinkiewicz and Hanan a simple type of L-systems are those known as deterministic 0L systems, where the string refers to the sequence of cellular states and '0L system' abbreviating 'Lindenmayer system with zero-sided interactions'. With 0L systems there are only three major parts. There is a set of symbols (*alphabet*), the starting string (*Axiom*) and state transition rules (*rules*). The alphabet is a set of states. The starting string is a starting point containing one or more states. The transition rules are rules that dictate whether a state should remain the same or transition into a different state or even disappear. [Prusinkiewicz and Hanan, 2013].

An example of a deterministic 0L system is that a simplified model for the growth of algae:

We are given the *alphabet*: A, B
and the *axiom*: A
and the *rule* set:
A → AB
B → A

If we then apply the rules to the L-system we find it creates the following generation structure.
1.) A
2.) AB
3.) ABA
4.) ABAAB
5.) ABAABABA
6.) ABAABABAABAAB

This rewriting of initial string using a set of rules is ultimately the underlying concept behind L-systems. There are a number of improvements that can be made to this type of L-system in

order to accommodate for more complex and intricate structure. One of which is the inclusion of *constants*. Constants can be considered any state that does not have a rule associated with it or remains the same from generation to generation and therefore holds a consistent value or meaning. Some examples of constants are stated below.

- +: Rotate to the right specified angle.
- -: Rotate to the left by a specified angle.
- [: Save the current position and angle.
-]: Load a saved position and angle.

2.2 Basic 2D L-systems

There are a number of fractal geometry that have become well known particularly with regards to how they can seemingly imitate nature [Mandelbrot, 1982]. Particularly with the geometry such as the Koch snowflake which can be represented using the following L-system.

Koch Curve:
Alphabet: F
Constants: +, -
Axiom: F
Angle: 90°
Rules:
F → F+F–F+F
Figure 2.1: Koch Curve.

Sierpinski Triangle:

Alphabet: A, B

Constants: +, -

Axiom: A

Angle: 60°

Rules:

A → B-A-B

B → A+B+A
Figure 2.2: Sierpinski Triangle.

Dragon Curve:

Alphabet: F, X, Y

Constants: +, -

Axiom: FX

Angle: 90°

Rules:

X → X+YF+

Y → -FX-Y
Figure 2.3: Dragon Curve.

Fractal Plant:
Alphabet: X, F
Constants: +, -, [,]
Axiom: X
Angle: 25°
Rules:
X → F-[[X]+X]+F[+FX]-X
F → FF
Figure 2.4: Fractal Plant.

Fractal Bush:
Alphabet: F
Constants: +, -, [,]
Axiom: F
Angle: 25°
Rules:
F → FF+[+F-F-F]-[-F+F+F]

Figure 2.5: Fractal Bush.
